

I want to hold your hand...Daddy.

It takes a skilled, multifaceted practitioner to create the “perfect” arm, leg or orthotic device for today’s limb-impaired patient or amputee.

These specialists oversee the process every step of the way—from designing the device, to creating it from raw materials, and finally to custom-fitting each patient for the best possible results.

For the expert practitioners who create these devices, seeing a little boy holding his father’s “new hand” makes all the hard work worthwhile.

For a father who wants to get back to living the American Dream with his family, arms and legs are not a luxury.
